RESOURCES
STOCKHOLM, SWEDEN, 5 SEPTEMBER 2010

EMERGING POLLUTANTS IN RIVERS OF EASTERN UKRAINE: MONITORING, ENVIRONMENTAL RISK ASSESSMENT AND SOCIO-ECONOMIC ISSUES

Yuliya Y. Vystavna*, Philippe Le Coustumer, Frederic
Huneau, Yuri I. Vergeles

EMERGING POLLUTANTS

- *Emergent (emerging) contaminants (pollutants)* are non-regulated or very partly regulated and mostly non incorporated in the relevant environmental legislation, but they have the potential to enter the environment and cause known or suspected adverse ecological and (or) human health effects (Kuster et al, 2006; Hanicke et al, 2007).
- Most *emerging pollutants* are man-made organic and nonorganic chemicals introduced into the environment by anthropogenic inputs (Zhang et al, 2008).
- Increasing standards of living, economic changes and human population growth lead to increased usage of various chemicals in households, office, industries, agriculture.
- More new pollutants will be found in nearest future with further development of analytical methods.

PPs

OBJECTIVES

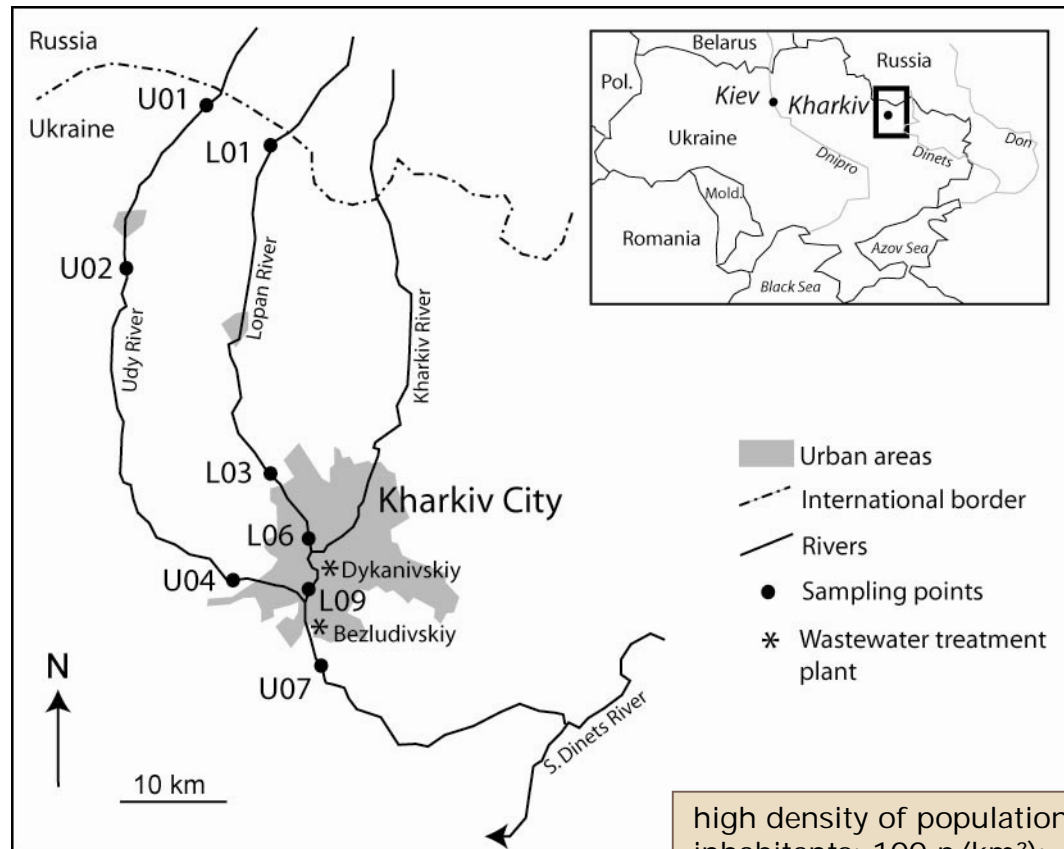

- What trace metals and pharmaceuticals are present in the two transboundary rivers of Eastern Ukraine?
- Which technologies for the identification of emerging pollutants are efficient for the pilot water monitoring?
- Are there any environmental and health risks caused by the presence of emerging pollutants in surface waters of Ukraine?
- What relation between socio-economic indicators and emerging pollutants in water?
- How the water quality data can be use for the socio-economic studies?
- What strategy can be proposed for the development of the water monitoring system taking into account emerging pollutants issues?

WATER MONITORING IN EASTERN UKRAINE

- The water quality of surface water in Ukraine does not meet national water quality standards and classified as ‘polluted’ or ‘extremely polluted’—uncontrolled wastewater discharge is one of the reason (National Report on the Drinking Water Quality in Ukraine, 2009)
- Ukraine still use the old Soviet system of water monitoring and water quality standards
- The monitoring of trace elements, emerging pollutants and others in Ukraine is yet insufficient (lack of equipment and financing for research laboratories and environmental control authorities)
- International legislation on the regulation of transboundary watersheds is underdeveloped and has poor practical implementation in some cases
- Environmental information and data on water quality are publishing in some national reports (National Report on Environmental Status; National Report on the Drinking Water Quality), but very limited, unavailable to the major part of the society and coming with significant delay (2-3 years)

THE STUDY AREA – the Kharkiv region (Eastern Ukraine)

Vystavna et

high density of population (total 2,8 mln. inhabitants; 100 p/km²); urban (78%) and rural (22%) settlements; industry (engineering and chemical industries, food production) and agriculture; water scarce region (3,41 km³ per year);

METHODS

1. **Standard sampling** of the water– to obtain data on major ions and dissolved metals and its correlation with labile forms;
2. **Passive sampling** – to get information on the presence of labile forms of trace metals (DGT) and pharmaceuticals (POCIS) as the most toxic for living organisms in rivers;
3. **Sediments analysis** – to add data on the deposition of metals in the sediments as potential source of secondary pollution of water;
4. **Statistical tools** – to analyze the origin, behavior and variations of trace metals and pharmaceuticals in water; determine the zones of pollution; process regional social and economic indicators;
5. **Mathematical modelling** – to process the environmental, social and economic data of water pollution by emergent pollutants

THE MONITORING

(2008-2010) – grab method or passive technique?

- **Grab method** – ions, dissolved metals, sediments
- **Passive technique** – labile metals (diffusive gradient in the thin film – DGT) and pharmaceuticals (polar organic chemical integrated sampler – POSIC) in the water

DGT (diffusive gradient in the thin film)

Figure 1. The Diffusive Gradient in Thin film devices (DGT) include the probe plastic housing (1) filter (2) diffusive gel and (3) resin gel layers

Figure 2. Principle for mercury accumulation and measurement with the DGT device. *DBL*: diffusive water boundary layer at the sampling surface of the device.

Sample Shipping

The POCIS should be transported to and from the sampling site in air-tight containers to prevent potential contamination from airborne chemicals. When possible, the POCIS should be shipped cold to preserve sample integrity.

Future Considerations

1. Determination of additional sampling rate data. Sampling rates are necessary to estimate the ambient water concentration of targeted chemicals. To date, a limited number of chemical sampling rates have been determined.
2. How to incorporate the Performance Reference Compound (PRC) approach into the POCIS. A PRC is a compound which is added to the POCIS during construction and is lost to the surrounding water during deployment. Determination of the amount of PRC lost provides an environmental adjustment factor to correct laboratory-derived sampling rates for the site-specific environmental factors. Initial studies indicate careful selection of the PRC and the sorbent used in the POCIS is necessary to allow measurable loss of chemical. This PRC approach has successfully been used with semipermeable membrane devices (SPMDs).

Polar Organic Chemical Integrative Sampler (POCIS)

Description and Application

Brief Background

The Polar Organic Chemical Integrative Sampler or POCIS is designed to sample water-soluble (polar or hydrophilic) organic chemicals from aqueous environments. The POCIS is an integrative sampler which provides time-weighted average concentrations of chemicals over deployment periods ranging from weeks to months. This device is a passive sampler meaning that it has no mechanical or moving parts, requires no power nor supervision during use. The POCIS samples chemicals from the dissolved phase, mimicking the respiratory exposure of aquatic organisms. The POCIS provides a highly reproducible means for monitoring contaminant levels, and it is largely unaffected by many environmental stressors that affect biomonitoring organisms. The POCIS also enables *in situ* concentration of trace organic contaminant mixtures for toxicity assessments and toxicity identification evaluation (TIE) approaches.

Physical Characteristics

The POCIS consists of a solid material (sorbent) contained between two microporous polyethersulfone membranes. The membranes allow water and dissolved chemicals to pass through to the sorbent where the chemicals are trapped. Larger materials such as sediment and particulate matter are excluded. The membrane resists biofouling which can significantly reduce the amount of chemical sampled. The type of sorbent used can be changed to specifically target certain chemicals or chemical classes. A standard POCIS consists of a sampling

Four POCIS are shown mounted in a stainless steel deployment container. Each POCIS has a sampling surface area of ~41cm². Generally, POCIS of different configurations are deployed together inside a single protective container to maximize the types of chemicals sampled. NOTE: The container's outer protective screen was removed for picture clarity.

TRACE METALS IN WATER AND SEDIMENTS OF UDY AND LOPAN RIVERS

- Priority trace elements (As, Cd, Cr, Cu, Hg, Ni, Pb and Zn)
- Urban tracer (Ag)
- and potentially toxic elements - Co, Mo, V and Th

TWO GROUPS OF ELEMENTS

- (1) Anthropogenic components (associates with anthropogenic sources) – Ag, Cd, Cr, Cu, Hg, Ni, Pb and Zn - form geochemical anomalies in the urban area
- (2) Natural regional components – Co, V, As and Mo - presents in low range concentration and mostly links to the regional geological baseline.

RESULT 1. LABILE METALS CONCENTRATION ($\mu\text{g/L}$) MEASURED WITH THE DGT METHOD IN THE LOPAN AND THE UDY RIVERS

January 2009

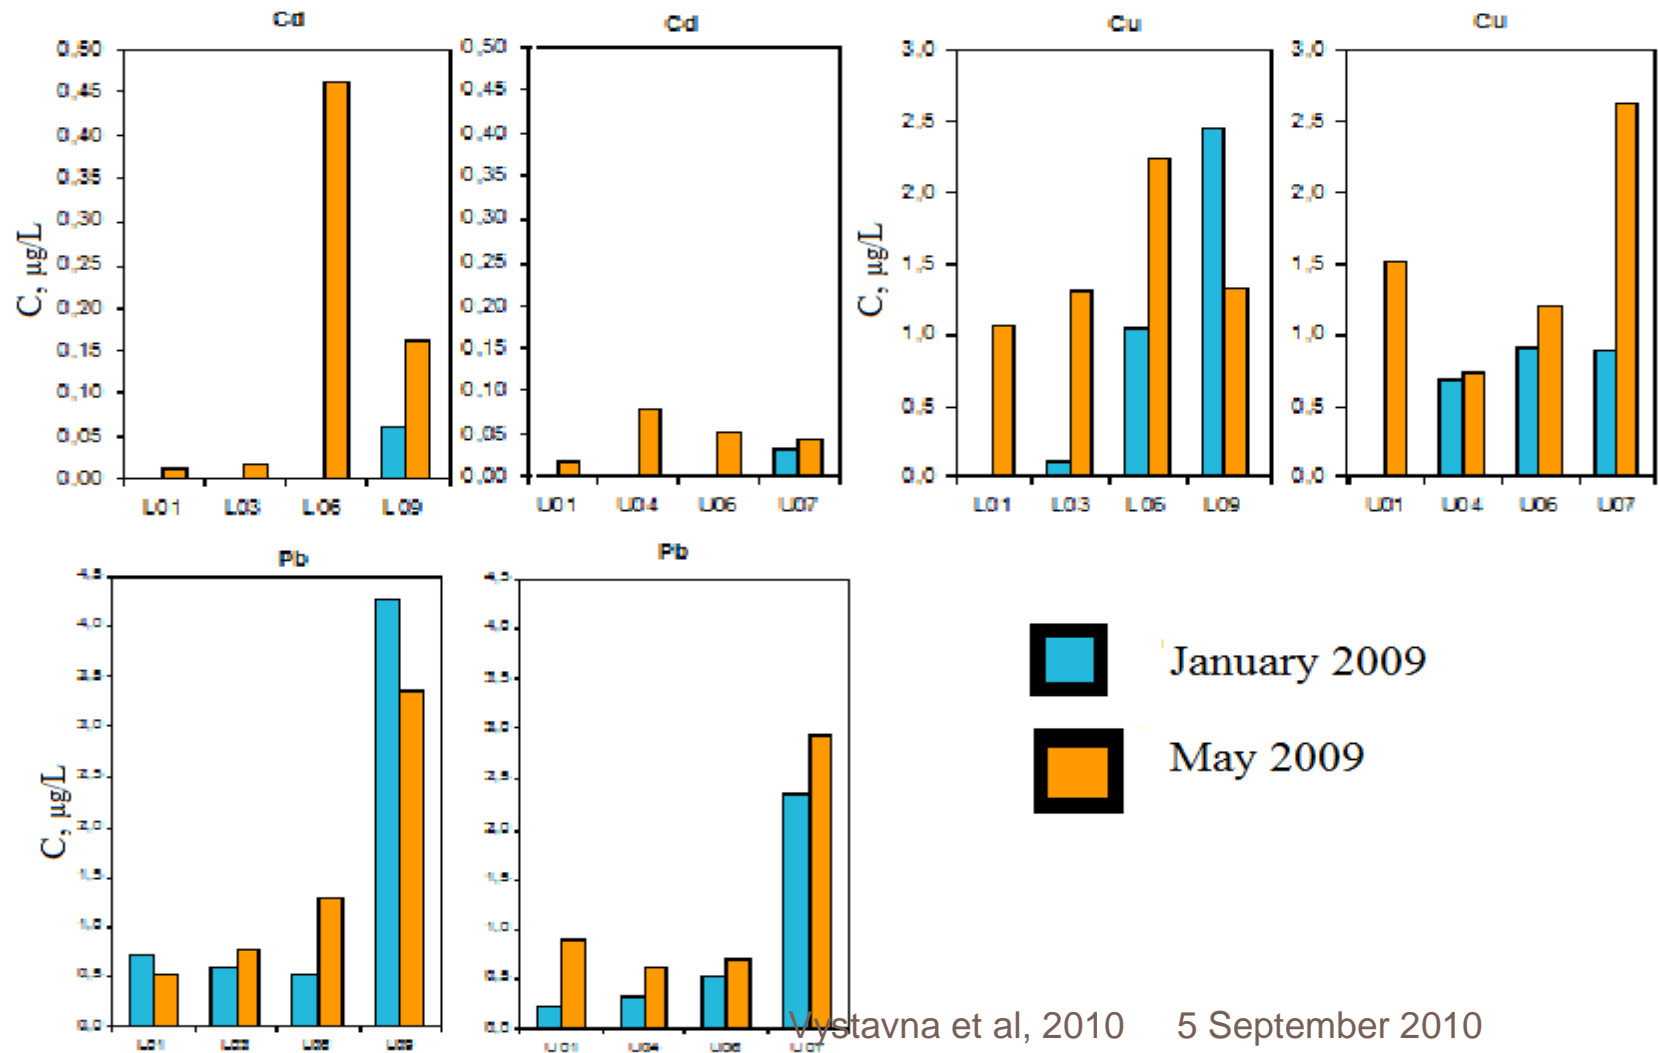

May 2009

Vystavna et al, 2010

PHARMACEUTICALS:

- psychiatric drugs: alprazolam, amitriptylline, diazepam, doxepine, fluxetine, imipramine, nordiazepam, carbamazepine, bromazepam;
- analgesics: aspirin, paracetamol;
- broncholidator: clenbuterol, salbutamol, terbutaline;
- non-steroidal anti-inflammatory drugs: diclofenac, ibuprofen, ketofen, naproxen;
- lipid regulator: gemfibrozil;
- stimulants: caffeine, theophylline.

RESULT 1: OCCURRENCE OF PHARMACEUTICALS IN LOPAN AND UDY RIVERS

Pharmaceutical	August 2008				January 2009			
	Udy River		Lopan River		Udy River		Lopan River	
	Up	Down	Up	Down	Up	Down	Up	Down

* from the paper Santos et al, 2010

NOEC – No observed effect concentration

LOEC – Lowest observed effect concentration

EC50 – Half maximal effect concentration

RESULT 4. MASS-BALANCE MODELLING OF DRUGS CONSUMPTION – APPLIED MODEL

$$M_c = (Q_{uw} (C_{wu} - C_u)) / (K_1 (1 - K_2))$$

M_c - drug consumption rate in a studied settlement, which is served by sewage system, (g d⁻¹);

K_1 – drug excretion rate (a part of a pharmaceutical component which enters a sewerage system in unchanged form with human excretion), (g g⁻¹).

K_2 – the efficiency of wastewater treatment processes, that was estimated a part of a pharmaceuticals what are removed during the treatment, (g g⁻¹)

C_u – the concentration of the pharmaceuticals in the upstream part, (g m⁻³);

The daily drug consumption rate per person (D) was estimated as:

$$D = M_c / P$$

□ Where P – is the number of people using the sewage system, inhabitants

RESULT 4. MASS-BALANCE MODELLING OF SOME DRUGS CONSUMPTION – COMPARISON WITH FRANCE

RESULT 4. MASS-BALANCE MODELLING OF SOME DRUGS CONSUMPTION – DATA VERIFICATION

PP	Fact (France, 2006)*	Calculated (France, 2009)
Carbamazepine	0.3	0.1
Diclofenac	4.3	0.3

*Coetsier et al, 2009

GENERAL CONCLUSIONS

- ▶ Emerging pollutants (trace metals and pharmaceuticals) are present in the urban and rural watershed regions and they have temporal, spatial and seasonal variations
- ▶ The highest accumulation of studied emerging pollutants was observed in the urban area downstream of WWTP
- ▶ Emerging pollutants monitoring is more efficient with the combination of grab and passive sampling techniques
- ▶ Presence of trace metals and some of pharmaceuticals (diclofenac, carbamazepine and ibuprofen) was at the dangerous level for the human health and ecosystem
- ▶ Socio-economic processes impact on the accumulation of the emerging pollutants in water

DISCUSSIONS

- ▶ The monitoring tool and system should be improved – ‘strategic monitoring’?
 - ▶ Additional water quality standards should be applied – ‘development of the analytical chemistry and monitoring tools’?
 - ▶ Preventive and protective measures are necessary to decrease the risk for the human health and ecosystem - ‘biotechnology’?
- ▶ Use of the water monitoring data in the socio-economic research and in other investigation – ‘drug and illicit drug consumption, drug market and etc’?
